

INFORMACIÓN Y ADVERTENCIAS

Esta **Guía de selección de filtros para respiradores** (a partir de aquí **guía**) pretende asistir al profesional de SSHH en la selección del filtro adecuado de acuerdo al agente contaminante presente en el ambiente. Simplemente indica, para un determinado agente físico o químico, la clase de filtro aprobado por NIOSH que se espera brinde la protección adecuada cuando se utiliza como parte de un dispositivo de protección respiratoria seleccionado siguiendo los lineamientos de la Normativa de Protección Respiratoria OSHA (Occupational Safety and Health Administration) 29 CFR1910.134. Esta **guía** no indica el dispositivo de protección respiratoria a utilizar ni tampoco la duración (service life) del filtro recomendado para un contaminante. La información contenida en esta **guía** es sólo una sugerencia en función del conocimiento de LIBUS pero es responsabilidad del usuario hacer la selección de dispositivo de protección respiratoria ya que la misma debe estar fundamentada sobre parámetros sólo conocidos por él, que incluyen, entre otros, condiciones específicas del lugar de trabajo, calidad del aire, identificación y concentración de contaminantes, identificación y evaluación de límites de tolerancia (OSHA PEL-Permissible Exposure Limits), NIOSH REL (National Institute for Occupational Safety and Health-Recommended Exposure Limit), otros), factor de protección requerido/asignado (APF), concentración IDLH, propiedades de advertencia, cambios horarios y cualquier otro factor que pueda afectar la salud y la seguridad del trabajador. Si no está seguro de la idoneidad de un respirador particular para una situación específica, no lo use ni permita su uso, no entre o permita que otros entren al área donde se requiere protección respiratoria y consulte a su supervisor o a un profesional de Seguridad e Higiene.

DESCRIPCIÓN DE LA TABLA DE AGENTES

Substance: nombre del agente en inglés tal como lo presenta la American Conference of Governmental Industrial Hygienists (ACGIH®).

CAS No.: número único de registro CAS (Chemical Abstract Service) establecido por la American Chemical Society (Sociedad Química de EEUU) para armonizar la identificación química.

Synonyms: sinónimos del agente (en inglés); en la mayoría de los casos como se presentan en la Pocket Guide to Chemical Hazards del National Institute for Occupational Safety and Health (NIOSH).

Sustancia: traducción al castellano del campo “**Substance**”.

IDLH: concentración considerada Inmediatamente Peligrosa para la Vida o la Salud (Immediately Dangerous to Life or Health) según la Pocket Guide to Chemical Hazards del National Institute for Occupational Safety and Health (NIOSH). Específicamente se refiere a la exposición respiratoria aguda que presenta una amenaza inmediata de muerte, efectos adversos a la salud, irreversibles, inmediatos o retardados, o exposiciones oculares agudas que impidan el escape de una atmósfera peligrosa.

El propósito de establecer un valor IDLH es (1) asegurar que el trabajador pueda escapar de un ambiente contaminado dado en caso de falla del equipo de protección respiratoria y (2) considerar un nivel máximo por encima del cual solo un aparato de respiración **altamente confiable** brinda protección al trabajador [NIOSH 2004]. Al establecer el valor IDLH, se deben garantizar las siguientes condiciones:

- A. La capacidad de escapar sin pérdida de vidas o efectos de salud irreversibles inmediatos o retrasados (30 minutos se considera el tiempo máximo para escapar a fin de proporcionar cierto margen de seguridad al calcular un valor IDLH).
- B. La prevención de irritación ocular o respiratoria severa u otras reacciones que dificultarían el escape.

El método NIOSH de selección lógica de un respirador utiliza el valor IDLH como uno de varios criterios de selección del mismo. Según esta lógica de decisión, se seleccionarán respiradores "altamente confiables" (es decir, los que brindan la mayor protección) para situaciones de emergencia, extinción de incendios, exposición a carcinógenos, entrada en atmósferas deficientes en oxígeno, entrada en atmósferas que contienen una sustancia con concentración mayor a 2000 veces el NIOSH REL o el OSHA PEL y para entrar en condiciones de peligro inmediato para la vida o la salud (IDLH). Estos respiradores "altamente confiables" incluyen un aparato de respiración autónomo (SCBA-Self Contained Breathing Apparatus) que tiene una pieza facial completa y se opera en una demanda de presión u otro modo de presión positiva o un respirador con suministro de aire (SAR-Supplied Air Respirator) que tiene una pieza facial completa y es operado en un modo de demanda de presión u otro modo de presión positiva en combinación con un SCBA auxiliar operado en un modo de demanda de presión u otro modo de presión positiva.

La tabla omite deliberadamente otros parámetros relacionados con la sustancia ya que el usuario debe consultar la última versión disponible de los mismos en la legislación local, OSHA, NIOSH, ACGIH, otros. Lo mismo aplica al IDLH que, sin embargo, es el único que hemos incluido en esta guía por ser un parámetro crítico tal como hemos explicado en los párrafos precedentes.

Referencias IDLH:

Ca sustancias que NIOSH considera posibles cancerígenos ocupacionales.

ND IDLH no determinado por NIOSH.

10%LEL indica que el IDLH se basó en el 10% del límite inferior de explosividad (LEL-Lower Explosive Limit) por razones de seguridad a pesar de que los datos toxicológicos relevantes indicaron que los efectos irreversibles para la salud o la disminución de las posibilidades de escape existían solo a concentraciones más altas.
